In Exercise, use these ideas to model each application with a differential equation. All rates are assumed to be with respect to time. The rate of growth of bacteria in a petri dish is proportional to the number of bacteria in the dish.

second kinds of first order differential equations. For example, much can be said about equations of the form $\frac{dy}{dx} = f(x, y)$ where f is a function of the two variables x and y . Under reasonable conditions on f , such an equation has a solution and the corresponding initial value problem has a unique solution.

Ordinary Differential Equations with MATLAB In this chapter we demonstrate the use of MATLAB in working with ordinary differential equations (ODE) and initial value problems (IVP) of the form $\frac{1}{2} y'' = f(t,y)$, $y(t_0) = y_0$. In particular, we discuss the following topics: 1. Numerical differentiation and solution of the IVP. 2.

The student will need a program that will plot the direction field for a single differential equation, and superimpose the solution with given initial conditions. In addition, the student will need a program that will plot the vector field for an autonomous planar system of equations, and superimpose the solution with given initial conditions.
