visualcasting scalable real time pdf

Visualcasting is a scalable real-time image distribution service to address this problem. Visualcasting includes a high-speed bridging system which receives pixel streams from rendering clusters to duplicate

experimental results for real-time multi-session visual mapping on wheeled and handheld datasets in the MIT Stata Center. These results demonstrate key capabilities that will serve as a foundation for future work in large-scale persistent visual mapping.

Real-time 6-DOF Multi-session Visual SLAM over Large Scale

By using a binary descriptor and metric-topological mapping, the system demonstrates real-time performance on a large-scale outdoor environment without utilizing GPUs or reducing input image size.

PDF | Accurately estimating a robot's pose relative to a global scene model and precisely tracking the pose in real-time is a fundamental problem for navigation and obstacle avoidance tasks.

Using visual and inertial sensors, i.e., a camera and an inertial measurement unit (IMU), enables localization under a wide range of conditions without relying on the availability of GPS or WiFi. State-of-the-art methods for online, low-latency visual (inertial) localization assume the existence of a 3D model of the scene.

To overcome this obstacle and enable real-time user interaction, we have designed and implemented a new parallel 2Portals is a low level communication layer on top of which MPI is implemented. ray-casting algorithm for volume rendering. Similar to the original one, our new algorithm supports adaptive rendering.

To meet the computational demands required of deep learning, cloud operators are turning toward specialized hardware for improved efficiency and performance. Project Brainwave, Microsoft[™]s principal infrastructure for AI serving in real time, accelerates deep neural network (DNN) inferencing in major services such as Bing[™]s intelligent search features and Azure.
